INTRODUCTION

The list of place names, with latitudes and longitudes, which is here presented, has been assembled from some seventy-four sources which range in size from 656 to two localities only. For the most part, these lists have been found in astronomical handbooks, *zijes*, where they enabled the astronomer to reduce observations reported from one locality to positions consonant with another. Some of the largest collections were intended to serve as a basis for plotting a world-map; others are found in works of descriptive geography. Isolated tables, frequently anonymous, have been encountered in bound volumes of manuscript treatises on various subjects. Finally, astronomical instruments, principally astrolabes, sometimes have geographical lists engraved upon them. Some have been incorporated into this collection.

Although the center of interest has been the medieval Islamic material, we have not hesitated to exploit sources which are earlier or later than the time span thus implied, provided that these are relevant to the main objective. Hence, coordinates due to Ptolemy (d. c. 180 A.D.), influential among Muslim geographers, will be found. At the other end of the time scale, some very late lists have been included because the entries seem to stem from much earlier documents.

In general, each entry in the list includes: a place name, in Latin characters and in Arabic, longitude, latitude, code designations of the source, location within the source, remarks, and cross references. Each of these categories is commented upon below.

Place Names in Latin Characters

Quite frequently a particular city will have two or more designations. Thus modern Istanbul is also known as Constantinople, and is most frequently found in the texts as **Qusṭantīniya**, occasionally as **Bizantīya**. But to insure that all occurrences of a particular locality can easily be retrieved from the computer storage for statistical purposes, all have been stored and printed under one name, chosen more or less arbitrarily. All other designations of the place known to us have been inserted in the list in the order of the Latin alphabet, whence cross references direct the reader to the single name under which all the coordinates appear.

A Q after a place name indicates that the reading is doubtful. Occasionally a single source gives the same place name twice, with different coordinates. Perhaps the original compiler conflated two or more different lists and carelessly failed to eliminate a duplication of cities. Under such circumstances, a 2 is entered behind the place name having the less customary coordinates. If for this city other sources give the same coordinates, 2's are entered with them also.

Place Names in Arabic

Most of the sources are unpublished manuscripts written in Arabic characters by scribes who were unfamiliar with many of the names they were copying. It is not surprising that words, particularly of Greek, Persian, Turkish, or other provenance, should become grotesquely corrupted in the course of successive recopyings over the centuries. In most cases experience, and comparison of the coordinates with those of other localities, make it possible to restore the original form. There are names, however, which we are unable to read, and the entries which appear are the products of subjective guesswork.

The commonest source of difficulty in reading place names stems from the role played by dots in distinguishing between characters. A letter appearing at the beginning or in the middle of a word is *nūn*, *tā*², *thā*², *bā*², *yā*², or *pā*², depending only on the number of dots, between one and three, placed above or below the line. It is very easy to omit the dots, or to put them down wrongly, or to combine them wrongly with the dots of contiguous letters.

Generally speaking, vowel sounds are not indicated in the sources. The reader is expected to know beforehand the vowels in the word at hand.

The only distinction between a terminal *hā*² and a *tā*² *marbūṭa* is the absence or presence of two dots. Many of the sources are in Persian, where the two letters are commonly confused, and the scribes tended to omit the dots entirely. In like manner, there being no definite article in Persian, the scribes exhibited a cavalier attitude toward the omission (or inclusion) of the Arabic *al*-.

Other difficulties are described in the section on longitudes and latitudes.

In order to facilitate the eventual identification of doubtful names, an effort has been made to enable a user who reads Arabic to see each name as it appears in the source. To this end, a code was adopted, hampered by the fact that when the collection was commenced, the only symbols accepted by the computer then available, aside from a few punctuation marks, were the upper case letters of the Latin alphabet, plus the ten decimal digits. In this publication the coded names have been turned back into Arabic, with dots missing or misplaced as in the source. For any locality in the alphabetical listing for which the space in the Arabic column is blank, the Arabic form is taken to be the same as the Arabic name appearing above it. For names obtained from Greek or Latin sources these spaces are, of course, blank.

Longitudes and Latitudes

Coordinates are reported in degrees and minutes of arc. Where the location of a city is well-known and modern coordinates are available they have been entered in the list. For purposes of computation, in order to appear as positive numbers, modern longitudes west of Greenwich have been recorded as east of Greenwich. Thus a longitude of 10° west of Greenwich is entered as 350°.

When a source clearly indicates that a particular latitude is south of the equator, a minus sign may have been entered before the degrees number.

Coordinates in the source are given as combinations of Arabic letters in the **abjad** numeral system, whereby integers are in a non-place-value decimal system, whereas minutes are in sexagesimals. There are well established conventions whereby, for instance, the two dots under the line to indicate a **yāʾ** (=10) are unambiguously omitted, whereas the single dot over the line denoting a **nūn** (=50) must be inserted. Thus **١٩** (**yāʾ**², **ṭāʾ**²) is 19, whereas **٥٩** (**nūn**, **ṭāʾ**²) is 59. A careless scribe need only omit a dot, or insert one which should not be there, to introduce an error in the coordinates. **Zāʾ** (=7), over which the dot is omitted, is easily misread as **dāl** (=4), or **wāw** (=6), and conversely. **Jīm** (=3) customarily has its dot omitted, and to distinguish it from **ḥāʾ** (=8), its tail is left off, the tail of the **ḥāʾ** being retained. When occurring at the beginning of a number, the only difference between **fāʾ** (=80) and **qāf** (=100) is in their dots, **fāʾ** having one and **qāf** two. It is easy for a scribe to get the dots wrong or to leave them out entirely. Where common sense or a comparison with other sources clearly indicate it, we have not hesitated to read in a missing dot, or to read a **zāʾ** as **dāl**, and so on. Otherwise we read the text as it is, making a plausible guess if necessary.

Zero Meridians

Unlike latitudes, which are universally measured from a natural reference, the terrestrial equator, longitudes are reckoned from a more or less arbitrarily chosen fixed meridian. Ptolemy measured longitudes east from the Fortunate Isles (Ar. *al-Jazā'ir al-Khālidat*), the Canaries, and about half our sources follow him. In the description of sources, the code designations of these tables are followed by a C. For all the other sources except three, corresponding longitudes tend to be ten degrees less than those of the C category, and some of the authors state explicitly that their base meridian is the "western shore of the encompassing sea (Atlantic)" (*sāhil al-baḥr al-muḥīt al-gharbī*), ten degrees east of the other. Such tables are designated by an A. It is not clear how this distinction came about, for Nallino has shown (p.490 of NAL in the list of sources) that it was not the intention of the early geographers of the Ma'mun school to shift the base meridian.

Two sources, HAM and HAB, measure longitudes west from a base meridian in the Far East. The author of the first says, in effect, that the relation connecting his longitudes with those of Ptolemy is

$$L + L_P = 193.5^\circ,$$

where the subscript P denotes Ptolemy.

Finally, one source, UTT, records longitudes from Basra (in Iraq) presumably his station.

Source Codes

To each of the sources a trilateral code has been assigned. The detailed description of sources which follows has been arranged in alphabetical order of the source code. In some cases, coordinates have been found in a secondary source with attribution to a primary source. For these, both codes are displayed. Thus, an

entry found in Bīrūnī's **Masudic Canon** is designated BIR. But a place whose coordinates are reported by Abū'l-Fidā³ as originating with Bīrūnī is designated FID BIR. For ease of computer operations a three digit numerical code has also been assigned, the numbers being, to the extent possible, in chronological order of the source.

References

This column gives for each source the folio or page, column, and location within the column where the particular entry is found. Peculiarities of individual sources are noted in the description of sources below. Short titles in boldface are references to the bibliography which immediately follows the tables.

Remarks

Other than for cross references, this column is used to give a name form in the source which differs from that given under the place name column, or to indicate other variant reading possibilities. Lack of space in this and the reference column has occasioned the use of unorthodox abbreviations and cryptic remarks. The notion is that incomplete information inelegantly presented is better than none at all.

Sortings of the Data

In addition to the basic alphabetical list, three other arrangements of place names are presented. The second displays localities by sources. In working with the astronomical literature a document may give one or both coordinates without naming the locality, or the locality may be illegible. It sometimes happens that a numerical table contains a latitude embedded as a parameter, and that analysis of the underlying function reveals the

latitude. In such cases it is useful to determine as many localities as possible to which a particular latitude, or longitude, has been assigned. For this reason, the third and fourth sortings are provided by increasing longitudes and by increasing latitudes. In detail, the four sortings are:

Alphabetical, place names in the order of the Latin alphabet, but giving also the Arabic names, when they exist and are known; within the same place name, cross references are listed first, then coordinate pairs in numerical order of the source code numbers, hence in approximate chronological order.

By Sources, in numerical order of source code numbers, (hence in approximate chronological order), thence in alphabetical order of place names in the source. Modern coordinates are not displayed, nor are the Arabic form of the names.

By Increasing Longitudes. All of the longitudes borne by localities in the collection are listed in increasing order. Under the particular longitude, on the left hand side of the column is a list of latitudes, in increasing order. The name of the locality bearing the coordinates thus specified appears behind the latitude. This is an index only. The user may then consult the alphabetical listing to obtain the source, location within the source, and the Arabic name.

By Increasing Latitudes, as above except for "longitude" read "latitude" and conversely.

Acknowledgments

The project began in 1959 with support provided by the National Science Foundation, Washington, D.C., as an attempt to investigate relations between zījēs. Some thousands of coordinate pairs were collected by Mr. Fuad I. Haddad at the American University of Beirut. At the

suggestion of the late Professor William Prager, the data were transferred to punched cards and sorted and printed by the IBM-7070 computer then at Brown University, Providence, Rhode Island. At that time such machines were not nearly as powerful and versatile as they have since become. Only capital letters, the ten decimal digits, and a few punctuation marks and special symbols could be stored and printed. The effects of these restrictions are evident in the present collection.

It soon became clear that astronomical tables were only part of a much larger corpus relevant to medieval mathematical geography, and purely geographical works were included. In 1976 the operation was transferred to the American Research Center in Egypt, supported by a grant from the Smithsonian Institution. There, and elsewhere several sources were supplied by Professor David King. At the computer center of the American University in Cairo the punched cards were replaced by magnetic tape. An additional displacement, in 1978, brought the collection back to the American University of Beirut, where Mr. Jihad Mukaddam had the data put into a machine language compatible with the new computer, and subsequently supervised programming. At this time, advice in statistical matters was obtained from Professor Mary Regier, and Dr. Reinhard Wieber supplied correlations between Greek and Arabic place names.

Since 1984, at the invitation of Professor Fuat Sezgin, whose counsel and support have been invaluable, we have worked at the Institut für Geschichte der Arabisch-Islamischen Wissenschaften at Frankfurt. From the Institute library additional sources have been added to the collection. The results owe much to the efficient and meticulous programming of Mr. Ulrich Dorenburg.

We are grateful to the individuals and institutions named above.

DESCRIPTION OF THE SOURCES

Following is a list of the documents from which sets of coordinates have been obtained. These are arranged in alphabetical order of the code designation, which leads each citation. Next is the numerical code, in parentheses. This is followed, where applicable, by an A or a C denoting that the source belongs to the "Atlantic" or "Canaries" category defined in the section above on zero meridians. Then comes the name of the document, followed in parentheses by the number of localities it gives; next the compiler's name, if known, and in parentheses his date in the Hijra and Christian calendars, if available. When appropriate, remarks are appended describing special qualities of the text, and its relationship to other sources. For names of the families or groups of related tables see page xlii below. For the definition of the M measure of relationship between sources, see page xi.

Unless otherwise noted in the description of a particular source, references in our list give the folio of the manuscript used, followed by two numbers. The first is the column in which the name of the locality appears, the second gives its place in the column.

ABD (566), C. The *zīj* (76 localities) of ʿAbd al-Qādir b. Ṣafāʾī al-Mawṣilī (c. 1143/1730). The presumably unique copy is MS 323 of the Jāmiʿ al-Bāshā Library at Mosul. We have used a copy of the microfilm in the Arab League Library, the geographical table being on f. 8v. With two exceptions it contains only localities in the Near and Middle East. For two places the scribe omitted the place names, giving only coordinates. In other instances the names have been badly garbled, but by comparing the coordinates with those given by other sources it has been possible to restore the names with reasonable certainty.

This table is related to SML, ULE, and QIR.

AIN (552), C. The *Ā'in-i Akbarī* (656 localities) by Abū'l-Faḍl 'Allāmī (c.988/1580), the Persian text edited by H. Blochmann, 3 vols., Calcutta, 1867-1877 (*Bibliotheca Indica* 58), vol. 2, pp. 29-47; translated by Blochmann (vol. 1) and H. S. Jarrett, 3 vols., Calcutta, 1868-1894, vol. 3, pp. 46-105. In obtaining coordinates, both the text and the translation have been used. References in our listing, however, are to pages of the text followed by the column number, thence by the location of the name in the column.

This is the largest source encountered, and it would be still larger, except that some place names listed have been given no coordinates. This source is strongly related to the Persian *zījes* TUS, KAS, and ULG, probably because of a common dependence of all upon ATH.

ASH (460), A. *Zīj-i Ashrafī* (244 localities, *Survey* No. 4) by Muḥammad b. Abī 'Abdallāh, Sanjar al-Kāmilī, known as Sayf-i Munajjim (710/1310). The unique extant copy is Paris B.N. Suppl. Pers. 1488, ff. 128r-130r.

This table relies upon BIR via SNB and SNH, and is closely related to SHA.

AST (560), C. An astrolabe (103 localities engraved on the back, c. 1122/1710) in the British Museum and described by Wm. H. Morley in *Description of a Planispheric Astrolabe Constructed for Shāh Sultān Husain Safawī...*, London, 1856; pp.24-26. Our references are to the page of the source, followed by the number of the locality in the list in AST.

The coordinates were probably obtained from ULG, hence they are related also to KAS, MUN, and especially TUS.

ATH FID (120), A. *Kitāb al-Aṭwāl* (athwal in FID, hence the code designation, 452 localities) wa'l-^curūd li'l-furs, the "Book of Longitudes and Latitudes of the Persians" (date unknown; Sprenger, in SPR, p. xxiv, argued that the unknown author lived after al-Bīrūnī, disagreeing with Reinaud, who placed him before). For the style of references, see FID, the sole source for this work.

ATH seems to be independent of all the early sources. However later compilers used it extensively. Tables dependent upon it include DST, TUS, MUN, KAS, ULG, and AIN, that is, the Persian zījes. TUS has a number of localities called "Non-inhabited" which are clearly useless for astronomical purposes. If, as seems reasonable, they were obtained from ATH, this indicates that the latter, like KHU and SUH, was the basic material for a world-map.

AUN YAG (247), A. The zīj (18 localities) of Abū ^cAun, Ishāq b. ^cAlī (before 628/1230), reported by YAG, and otherwise unknown to the literature (see HEER, p. 24, and NAL, p. 508). It is probable that the coordinates listed under ZIJ, which see, are also part of AUN.

The bulk of the coordinates seem to have been taken from KHU, so that the geographical part of the zīj was a version of the Ma'mūnīc geography. But the occurrence of one coordinate pair from BIR argues for a date of composition in the eleventh century or later.

BAG (370), A. The zīj (157 localities, Survey No. 3) of Jamāl al-Dīn Abū'l-Qāsim b. Maḥfūẓ al-Baghdādī (c. 684/1285). The unique copy is Paris B.N. MS ar. 2486, ff. 162r-163v. The table is derivative from BAT, and related to QBL.

BAN (390), A. *Minhāj al-ṭālib li-ta'dīl al-kawākib* (32 localities) by Aḥmad b. Muḥammad Ibn al-Bannā²

(d. 721/1321) published by J. Vernet-Ginés as *Contribución al estudio de la labor astronómica de Ibn al-Bannā*², Tetuan, 1951, p. 75. The text's entries are numbered, and our references give these numbers. The table seems to be independent of other sources.

BAT (130), C. Al-Zij al-Ṣābi³ (273 localities, of which 93 are regions not cities, *Survey* No. 55) by Muḥammad b. Jābir al-Battānī (c. 287/900) edited and translated by C. A. Nallino as *Al-Battānī sive Albatenii opus astronomicum*, 3 vols., Milan, 1899-1907; vol. 2, pp. 33-34. (The number in the reference column of our table is that given each locality in the text publication.) BAT has also been used for alternative coordinates for KHU and PTO, which see. Al-Battānī, in contrast to most Muslim authors, depended directly upon Ptolemy. In turn, his table influenced QBL and BAG.

BIR (170), A. Al-Qānūn al-Mas'ūdī (604 localities, *Survey* No. 59), the zīj of Abū'l-Rayḥān Muḥammad b. Aḥmad al-Bīrūnī (c. 432/1040), 3 vols., Hyderabad-Dn., 1954-56; vol. 2, pp. 547-579. In Biruni's text the entries are arranged according to geographical regions, named along the edge of the pages, and numbered within these regions. In our table we give in the reference column the page of the text, an abbreviation for the region, and the number of the city within the region.

Except for AIN, this is the largest of our sources, and it is to a great extent independent of its predecessors. Sources SNB, ASH, and SHA depend heavily upon it. Considering al-Bīrūnī's prestige, it is surprising that it was not more influential.

BIR FID (180), A. Coordinates (279 localities) from Al-Qānūn al-Mas'ūdī as reported by Abū'l-Fidā³ (d. 732/1331). For the style of references see FID.

BNA (340), A. A zīj (90 localities), anonymous (date unknown), Paris B.N. MS arabe 2523, f. 97r. This table, except for scribal errors, is essentially the same as FAR, hence any remarks which apply to the latter are valid for BNA also.

BNY (150), A. A zīj (86 localities), anonymous (720/1320 ?), based on YUN, Paris B.N. MS arabe 2513, ff. 88v-89v. References in our listing give the folio number, then the column in which the locality appears, then its number in the column. The dependence upon YUN applies also to the geographical table.

DST (240), C. *Dustūr al-munajjimīn* (115 localities), a collection of chronological and astronomical tables compiled by an anonymous member of the *Ismāʿīlīya* sect (c. 494/1100), Paris B.N. MS arabe 5968, ff. 65r-67v (GAS, 6, 63). The entries are restricted to Arabia, Syria, ʿIrāq, and Africa. This table is strongly dependent upon ATH, hence belongs to the group of Persian zijes, although it is in Arabic.

FAR (320), A. *Al-Zīj al-mumtaḥan al-ʿarabī* (91 localities), anonymous (Cambridge MS Gg.3.27, f. 51r; see DAK, pp. 25, 38), but previously attributed to Muḥammad b. Abī Bakr al-Fārisī, hence the code designation. Four-fifths of the entries in this table are identical with those of SHR below, which see, except for scribal errors. Moreover, FAR is essentially the same table as BNA. Both have depended upon KHJ and KHZ, and are closely related to YUN and SAN, hence are members of the Maʾmūnic family. Except for Tibet and the mythical Magog, all listed localities are in the Near and Middle East.

51r

FID (450). The geography of Abū'l-Fidāʾ (d. 732/1331), published by J. T. Reinaud and MacGuckin de Slane as *Géographie d'Aboulféda, texte arabe* (Taqwīm al-buldān), Paris, 1840;... traduite de l'arabe en

français vols. 1 and 2 pt. 1, M. Reinaud, 1848; vol. 2, pt. 2, S. Guyard, 1883. The translation was reprinted in 1985 by the Institut für Geschichte der Arabisch-Islamischen Wissenschaften, Frankfurt, as Reihe B, Geographie, vols. 1,1 and 1,2. (In our table, entries from FID give in the reference column either a reference to the Arabic text with page number, or a page number followed by V21 or V22. The first denotes "translation, volume 2, part 1", the second "translation, volume 2, part 2".)

Abū'l-Fidā³ is unique (except for YAQ) in that, with few exceptions, he names the source from which each pair of coordinates has been obtained. He is our only source for ATH, QYS, and ZDJ, which see. For BIR, RES, and SAA he is a secondary source, useful as a control on the primary. The code number 450 is employed only for the thirty-two localities for which FID gives no primary source.

FRK (554), C. An astrolabe (38 localities) made in Lahore (in 1018/1609), property of the Kestner Museum, Hannover (Catalog No. 1914,61). It is described by Josef Frank and Max Meyerhof in "Ein Astrolab aus dem indischen Mogulreiche", **Akten der von Portheim-Stiftung**, 13, Heidelberg: C. F. Winter, 1925, pp. 34-38. Our references cite the page on which the city is named, and its footnote number on the page. The coordinates were probably obtained from ULG or AIN.

GT1 (500), C. An isolated table (100 localities), anonymous (date unknown, but probably late), in the Forschungsbibliothek (formerly Herzogliche Bibliothek), Gotha, MS 1391, f. 28v. The compiler or the copyist was careless and ignorant, for names and numbers are badly garbled. The table is closely related to KUS, and falls in the Ma'munic group.

GT2 (505), C. An isolated table (59 localities), anonymous (date unknown), in the Forschungsbibliothek (formerly Herzogliche Bibliothek), Gotha, MS 1467, f. 29v. The table was written by a scribe who sometimes made nonsensical entries. Perhaps partly because of this, it exhibits no strong relation to any other source.

HAB HAM (058). Ḥabash al-Ḥāsib al-Marwazī (2 localities), an eminent 'Abbāsid astronomer (fl. 288/900, GAS, 6, 173-175). The coordinates attributed to him are given by al-Hamdānī, HAM (133). They are entered, in spite of there being only two localities, because of his special importance, and because the longitudes are reckoned from the east.

HAM (133). *Ṣifāt jazīrat al-ʿarab* (21 localities) by Abū Muḥammad al-Ḥasan b. Aḥmad ... b. Yaʿqūb al-Hamdānī (d. 334/945), edited by David Heinrich Müller as *Al-Hamdānī's Geographie der arabischen Halbinsel*, Leiden: Brill, 1884-1891. Reprinted: Brill 1968.

In spite of the small number of coordinates reported, the source is of unique interest as being the only one in which longitudes are reckoned from the east. (This is indicated in our remarks column.) In a few cases Hamdānī names his own sources, Ḥabash, HAB (058), and al-Fazārī, fl. 154/770.

HON. Ernst Honigmann, *Die sieben Klimata und die Poleis episemoi*, Heidelberg, 1929, has been used as a secondary source for localities in KHU and PTO.

HTP (010), C. The *Handy Tables* (362 localities) of Ptolemy (c. 140 A.D.) published by N. Halma as *Commentaire de Théon d'Alexandrie sur les tables manuelles astronomiques de Ptolémée*, in three parts, Paris, 1822-25. The geographical table is in Part 1, pp. 109-131.

This list shows practically no relation to any of the medieval tables, partly because the place names are in their ancient form, and for most of them the medieval equivalents have not been established.

IKH (135). *Rasā'il Ikhwān al-ṣafā'* (76 localities, c. 360/970), 4 vols., Beirut, 1957, vol. 1, pp. 170-179. Most of the coordinates are so corrupt as to be useless; the place names are of some interest.

KAS (510). C. The *Zij-i Khāqānī* (515 localities, Survey No. 20) by Jamshīd Ghiyāth al-Dīn al-Kāshī (c. 823/1420). The copy used is India Office (later Commonwealth Relations Office) Library, Persian MS 430 (Ethe 2232), ff. 72v-74v, collated with Aya Sofya (Istanbul) MS 2692. In the text the entries are arranged according to climates and numbered within the climate. In our table, in the reference column for each entry the folio is given, followed by the number within the climate.

This is our fourth largest table, hence it contains localities not found in most sources. As one of the group of Persian zijes it is closely related to TUS, ULG, and AIN, hence also to ATH.

KHL (490). A. This is from a treatise (96 localities) by Shams al-Dīn al-Khalīlī (762/1360) in Paris B.N. ar. 2558. At the top of f. 51v, which contains 48 entries, a statement says the coordinates were copied from Shams al-Dīn al-Mizzī (the author of MIZ). At the top of f. 52r is a title saying the localities are stations for pilgrims on the way to Mecca. This table is unrelated to all others except, of course, MIZ.

KHU (050). A. The geography (545 localities) of al-Khwārizmī (c. 205/820) published by Hans von Mīlik as *Kitāb Ṣūrat al-arḍ* by Abū Ja'far Muḥammad ibn Mūsā al-Khwārizmī, Leipzig: Harrassowitz, 1926

(subsequently reprinted). The text includes mountains, seas, etc.; but our excerpt has only cities. In the printed text, each entry has one number, in parentheses, and sometimes a second, in square brackets (references to SUH below). In the reference column in our table we give the page number followed by the number in parentheses.

This is our third largest source, the earliest extensive medieval list, and it influenced practically all subsequent tables. Al-Khwārizmī was prominent in the scientific entourage of the caliph al-Ma'mūn, and this table was the progenitor of the Ma'mūnic group. KHZ and RES are to be regarded as subsets of this table. KHU was studied by Nallino (in NAL), and his conclusions are still valid, to the extent they are unaffected by the use of sources unavailable to him.

KHU BAT (051), A. These are the thirty-seven entries from the manuscript upon which KHU is based, but reported by Nallino in BAT. In our table they are referred to by the numbers assigned the corresponding localities in BAT. In general, they are reported only when there are variants in the KHU, KHZ tradition, and they are not displayed in the listing by sources.

KHU HON (053), A. These are ten entries from KHU as reported by Honigsmann in two lists, pp. 126-131 and 144-150 in HON. In our reference column the page is given followed by the number in the list. The coordinates must be sought in the Khwārizmī column. Being variant readings they are not displayed in our listing by sources.

KHU NAL (052), A. These are entries from KHU as reported by Nallino in NAL, mostly variant readings, hence not displayed in our listing by sources.

KHZ (055), A. This table (163 localities) is attributed to al-Khwārizmī (c. 205/820), bound with other short treatises in Aya Sofya (Istanbul) MS 4830, ff. 194v-196. References in our list give the folio of the text, the column on the page, and the place in the column. Since $M(KHZ, KHU) = 74$ it is to be regarded as a subset of KHU, but with useful variants.

KUS (160), C. *Al-Zīj al-jāmi*^c (90 localities, Survey No. 9, GAS, 6, 247) by Kūshyār b. Labbān (c. 380/990). Our list has been collated from two copies of this work. The first is Leiden Cod. Or. 8. In it a geographical table in the body of the zīj has been left blank. But on f. 132r, after the colophon of the zīj, a table appears. Its entries are referred to in our list by a pair of numbers following the folio number. The first gives the column, the second the place of the locality in the column. Variant readings noted in the remarks column refer to this copy as LEY.

The second copy is (Istanbul) Fatih MS 3418, the geographical table of which is on f. 87v. Variants listed for it are designated by FAT.

This table belongs to the Ma³mūnīc group, and in particular ZAY and GT1 are strongly related to it.

LYD (345), A. An isolated table (170 localities), anonymous (date unknown), contained in Leiden Cod. 1001 (15) Warn., ff. 121v-124v. At the end of the table proper is a list of pilgrim stations, some being duplicates of previous entries. The scribe uses in different places two distinct versions of the sexagesimal zero symbol, both being derived from Greek papyri. Place names are sometimes misspelled, and sometimes have nonsensical coordinates. This table is, in effect, a subset of ZAY, which see.

MAG (350), C. A zīj (211 localities, the later of two, see TAJ below) written by Muḥyī al-Dīn Yahyā b. Muḥammad b. Abī al-Shukr al-Maghribī (675/1276). The copy used is that of the Shrine Library, Meshed (Mashhad), Iran, f. 61. MAG and TAJ are related, but not closely. MAG has some affinity with the group of Persian zījēs, which is not surprising, since Muḥyī al-Dīn worked with al-Ṭūsī, the author of TUS, at the Marāgha observatory.

MAR (360), C. This table is from *Jāmi' al-mabādi' wa'l-ghāyāt fi-'ilm al-mīqāt* (134 localities) by Abū'l-Ḥasan 'Alī al-Marrākushī (c. 648/1250). The text has been published in facsimile by the Institut für Geschichte der Arabisch-Islamischen Wissenschaften, Frankfurt, 1984, as 2 vols., series C-1. However, references in our table are to pages of the French translation by J.-J. Sédillot, *Traité des instruments astronomiques des Arabes...*, vol. 1, Paris, 1834 (Reprint Frankfurt, 1986). The translation has been collated with the manuscript copy used by the translators, Paris B.N. ar. 2507, ff. 66r-67r, 77v, 78r. In the text, longitudes and latitudes are in separate tables, hence in our reference column two page numbers appear, plus the number of the entry where there is room.

The table is related only to ZAY, perhaps because both authors were from the western part of the Islamic world, and tended to record more localities there.

MIZ (485), A. The table (48 entries) is due to Muḥammad b. Aḥmad b. 'Abdarrahīm Shams al-Dīn Abū 'Abdallāh al-Mizzī (c. 751/1350, SUT No. 406), found in the Egyptian National Library (Cairo), MS mīqāt 167 (Muṣṭafā Fāḍil), f. 95v. References in our list give an R or an L indicating the right or left column respectively, followed by a number which places the locality in the column. The bulk of the localities are in Syria, with a few in Arabia, Iraq, and Iran. Many of the coordinates stem from ATH.

054
MLH YAQ (065). The **Kitāb al-Malḥama** (2 localities) was a work (date unknown) on astrological geography, spuriously attributed to Ptolemy (cf. GAS, vol. 7, pp. 43, 46). YAQ is the sole source of coordinates from it. More often than not, when the **Malḥama** is cited, Ptolemy is named along with it, but there are thirty-two cities which give Ptolemy alone as a source. It is probable that these also are from the **Malḥama**, but to play safe they have been recorded as a separate source, YAQ PTO (045), which see. Usually, but not always, for both categories the coordinates are followed by astrological attributes peculiar to each city. There are seven cities in YAQ with astrological material, but which are not associated either with the **Malḥama** or Ptolemy. The numbers are corrupt, and difficult to associate with other sources. About a quarter of them seem to have come from Ptolemy's geography. But a lesser number are of the Maṣmūnīc school, which argues for a post-Ptolemaic date of composition.

MOD (570). For almost all the modern coordinates the **Times Atlas of the World**, London, has been used as a source. Since 1980 the **Times Atlas**, Comprehensive Edition, London, 6th ed., 1983, and 7th ed., 1985, have also been employed. Where this is the case TAC (sometimes TACOMED) appears in the reference column. Occasionally other sources are used, and are so indicated.

MRS (245), A. The **Marseilles Tables** (55 localities, 6th/12th century), published by J. K. Wright in "Latitudes and Longitudes in the Middle Ages", **Isis**, 5(1923), pp. 75-98. The table is on pp. 87-88. Our references give the number of the locality in the source followed by the page on which it appears. The table is essentially a copy of TOL, which see.

MSH YAQ (047). A collection (10 localities) giving latitudes only, and these to integer degrees, the places all being in Egypt, is attributed by YAQ (vol. 4, p. 545) to Ibn (sic) Māshā'allāh (c. 164/780). Māshā'allāh (see GAS, vol. 7, pp. 102-108) was one of the most famous medieval astrologers. The attribution to a son (ibn) may be an error.

MSR (475), A. This table (47 localities, date unknown), f. 96r of Egyptian National Library (Cairo), MS mīqāt 167 (Muṣṭafā Fāḍil), according to a statement at the top of the page, consists of "observations verified by the Egyptians (miṣrīyīn)". The references in our list give an R or an L indicating the right or left column respectively, followed by a number which places the locality in the column.

Practically all the localities are in Egypt and Syria, plus the Arabian holy places, three in Iran, and "China" for good measure. The table is related to ZAY and LYD.

MUF (210), C. *Zij-i mufrad* (99 localities, Survey No. 65) by Abū Ja'far Muḥammad b. Ayyūb al-Ṭabarī (c. 478/1085) in Cambridge University Browne Or. MS 0.1.(1a), ff. 173v-174r. The manuscript contains fragments of at least two different *zījes*, and this table may not belong to the *Mufrad*. Many coordinates seem unreliable, and the place names are carelessly or ignorantly written. The table is strongly related to KUS, less so to other members of the Ma'mūnic group.

MUH (400), A. *Al-Zij al-mukhtār* (120 localities), anonymous (date unknown), the planetary parameters being those of YUN. The copy used is British Museum MS Or. 3625, ff. 184v-185r. The hand is easily legible, but many entries have been garbled. The table belongs to the Ma'mūnic group, and is effectively a copy of ZAD, or vice versa.

MUN (470), C. The zīj (256 localities, **Survey** No. 35) of Muḥammad b. ʿAlī, known as Shams al-Munajjim al-Wābaknawī (c. 731/1330), the unique extant copy being Aya Sofya (Istanbul) MS 2694, ff. 148v-149v. This table is to some extent dependent upon ATH, and is practically a subset of TUS, hence is one of the group of Persian zījēs.

NAL C. A. Nallino, "Al-Khuwārizmī e il suo rifacimento della geografia di Tolomeo", pp. 458-532 of Nallino, **Raccolta di scritti editi e inediti**, vol. 5, Rome, 1944. The work first appeared in the **Memorie della Accademia dei Lincei**, Classe di scienze morali, storiche e filologiche, serie V, vol. 2, parte 1a. It has no code number, being used as a secondary source for KHU and PTO.

PTO (020), C. The geography of Ptolemy (213 localities). No attempt has been made to list systematically the thousands of localities given by Ptolemy (c. 140 A.D.). However, his coordinates have been entered when it is possible to compare them with those of corresponding localities in the Islamic sources. These have been garnered from four secondary sources, listed below:

(1) Most of these are from the published version of Battānī's zīj (BAT), vol. 2, pp. 33-54. Entries from this list show a single number on the right-hand side of our reference column. This is the number in the Battānī list, which runs up to 273. In the remarks column, which follows, the location of the locality in the Nobbe edition of the **Geography** is shown, followed by the Greek name of the place.

(2) Forty-five localities have been obtained from Nallino's **Raccolta** (NAL). Such entries are distinguished by a P on the left-hand side of the reference column followed by a number (greater than 490) indicating the page in the source.

(3) Thirty-eight places are from Mzik's *Afrika nach der arabischen Bearbeitung...* (MZK). These entries cite a page from the source, followed by a number, which is that assigned to the locality in KHU. The Greek name is given in the remarks column.

(4) Fifteen are from the numbered list on pp. 126-131 of Honigsmann's *Die sieben Klimata* (HON). The references are to page and number of place.

PTO HON (040),

PTO NAL (030). These code numbers, 030 and 040 are employed for entries from the geography of Ptolemy in the event that there are variants for the same locality as reported under PTO (020). There are only six of these, and they are not displayed in the listing by sources.

QBL (155), C. *Kitāb al-Tahdhīb fī maʿrifat al-qibla wa naṣb al-mahārīb* (303 localities), by Zayn (?) al-Dīn al-Dīmīyātī (date unknown). The unique copy is Bodleian Marsh 552, ff. 103r-114r. References in our listing are to the folio on which the locality appears, then its number on that folio. The coordinates are written out in words and then duplicated in numerals. However, the scribe was careless, and sometimes the two representations differ. Many coordinates have been rounded to integer degrees. In spite of the latter, which would tend to reduce the M measure (see page xl), the table is clearly related to BAT and BAG. However it also has some localities in KHU or SUH which are not in BAT, and some which are unique to our collection. Hence it is a source of considerable independent interest.

QIR (540), C. The zīj (81 localities, Survey No. 81) of Qiryāqus (or Cyriacus, c. 885/1480), using the unique Bodleian MS Laud Or. 253, f. 85v. The table belongs

to the Ma³mūnic group. It is essentially the same as ULE and SML, and very strongly related to ABD.

QYS FID (420), A. Al-Qiyās (al-mumtaḥan, 94 localities), reported only by FID, where it is transliterated also as *Kyas*, presumably another name for al-Zij al-mumtaḥan (Survey, No. 51, c. 195/810), if the conjectures in HON, p. 136, and FID, transl., vol. 1, p. xlvii, are correct. For the style of references, see FID. The latitudes as reported seem independent of other sources, with a slight leaning towards KAS.

RES FID (054), A. Kitāb Rasm (resm in FID, hence the code designation), al-rub^c al-ma^cmūr (91 localities c. 205/820), said to have been translated from Greek into Arabic at the behest of the caliph al-Ma³mūn (FID, transl., vol. 2, pt. 1, p. 97), in effect another name for our source KHU, the Ma³mūnic geography. This is demonstrated by the fact that M(RES, KHU) = 80. (For the style of references in our table, see FID.)

SAA (270), A. Kitāb Baṣṭ al-arḍ fi'l-tūl wa'l-^carḍ (432 localities) by Abū'l-Ḥasan ^cAlī b. Mūsā Ibn Sa^cīd al-Maghribī (d. 685/1286), edited by J. Vernet-Ginés, Tetuan, 1958. The coordinates are not collected in a table, but are scattered throughout the book, of which our references give the page. Ibn Sa^cīd mentions many cities which he fixes with respect to others, but without giving coordinates. These have necessarily been omitted from our list. This source exhibits no strong affiliation with any other except, not surprisingly, the same Ibn Sa^cīd as reported by Abū'l-Fidā³ (SAA FID).

SAA FID (280), A. Coordinates (210 localities) reported from Ibn Sa^cīd al-Maghribī by Abū'l-Fidā³. The ultimate source is SAA, which see. For the style of references, see FID.

SAL (569). This is a consolidated table (222 entries) reporting coordinates found in a collection of fifty-two astrolabes described by Sharon Gibbs and George Saliba in *Planispheric Astrolabes from the National Museum of American History*. Washington: Smithsonian Institution Press, 1984, pp. 192-200. Our references give the page of SAL where the locality is listed, followed by its place counting from the top of each page.

SAN (405), A. *Al-Zīj al-majmūʿ li-ṭūl Ṣanʿāʾ al-Yaman* (123 localities), anonymous (date unknown), Ṣāḥirīya (Damascus) MS 3092. The geographical list is on the left-hand side of f. 67v., arranged in four columns. Our references give the number of the locality within the column, then the number of the column. The list has many localities unique to the collection, written in a partially illegible hand. These places seem to be in the Yemen, where the zīj was composed. This also accounts for its relationship to SHR, FAR, and ZAD, which are also Yemeni. The table belongs to the Maʾmūnīc group.

SHA (480), A. *Al-Zīj al-jadīd* (251 localities, Survey No. 11) by Abū'l-Ḥasan ʿAlī b. Ibrāhīm, known as Ibn al-Shāṭir (c. 751/1350). The copy used here is Bodleian MS Seld. Arch A 30, ff. 155r-158r. As is the case with BİR, the table is divided into geographical regions named along the edge of the page. In our table the reference column gives the folio on which the locality is found, followed by an abbreviation for the region, thence the number of the city within the region.

This is one of the Bīrūnī group of tables, being closely related to SNB, SNH, and ASH.

SHR (310), A. *Al-Zīj al-Muẓaffarī* or *al-Zīj al-mumtaḥan al-khazāʾinī* or *Zīj al-Fārisī* (90 localities) by Muḥammad b. Abī Bakr al-Fārisī (c. 659/1260). The table is based on that of ʿAbd al-Karīm al-Shirwānī

al-Fahhād hence the code designation (see DAK, p. 25). Al-Shirwānī's zīj is extant, but was unavailable for our collection. The manuscript used here is Cambridge University MS Gg.3.27, f. 113r. Four-fifths of the entries in SHR are, except for scribal errors, identical with FAR, so any conclusions reached concerning the latter apply to SHR also.

SML (220), C. **Al-Zīj al-shāmil** (78 localities, **Survey No. 29**), anonymous (after 473/1080). The copy used is Paris B.N. MS arabe 2528, f. 19v. This is practically the same table as ULE and QIR, and is closely related to ABD.

SNB (242), A. A version of **al-Zīj al-Sanjarī** (162 localities, **Survey No. 27**) by ʿAbd al-Rahmān al-Khāzinī (c. 514/1120). This is British Library MS Or. 6669, ff. 104v-106r. This table, like SNH, the other copy of the Sanjarī zīj, belongs to the Bīrūnī group. It is, in effect, a subset of SHA and closely related to ASH.

SNH (243), A. A version of **al-Zīj al-Sanjarī** (111 localities, **Survey No. 27**) by ʿAbd al-Rahmān al-Khāzinī (c. 514/1120). This is Hamidiye (Istanbul) MS 859, f. 29v. The other copy of the Sanjarī zīj is SNB, which see. SNH apparently had fewer entries than SNB to begin with. To them were added twenty localities in a different hand from the rest of the MS, together with remarks in Persian, whereas the zīj is in Arabic. These additions can be regarded as a contamination, weakening the relations to BIR, ASH, and SHA.

SUH (060), A. **Kitāb ʿAjāʾib al-aqālīm al-sabʿa ilā nihāyat al-ʿamāra** (492 localities, c. 318/930) by Suhrāb, edited by Hans von Mǝik, Leipzig, 1929. References in our listing give the page of the published text and the number in square brackets associated with the locality. A second number in the text, in parentheses, is the number assigned to the

locality in KHU. The author is known also as Ibn Sarābiyūn (Serapion, see EI2, vol. 3, p. 929; GAL, SI, p. 406). This is a reworking of KHU.

SXN (558), C. A sexpartite astrolabe (34 localities, 1076/1665) described by Wm. H. Morley in pp. 37, 38 of the publication which is the source for AST, which see. Our references give the page of the source and the column in which the locality is listed. The coordinates were probably obtained from ULG.

SXT (556), C. A sexpartite astrolabe (22 localities, date unknown) described by Wm. H. Morley in pp. 39, 40 of the publication which is the source for AST, which see. Our references give the page of the source and the column in which the locality is listed. The coordinates probably were obtained from ULG.

S25 (557), C. This table (46 localities) is engraved on astrolabe CCA 25, made by Muḥammad Mahdī b. Muḥammad Amīn al-Yazdī (1078/1667) and described in pp. 29, 65-68 of SAL above. Our references give the page listing the locality and its number on that page of SAL. The coordinates are closest to ULG.

S44 (555), C. This table (49 localities) is engraved on astrolabe CCA 44, by the maker of CCA 25 above (c. 1071/1660) and described in pp. 79-82, 205 of SAL above. Our references give the page listing the locality and its number in the table on that page of SAL. The coordinates exhibit no strong dependence upon other tables.

TAJ (300), C. *Tāj al-azyāj* (146 localities, Survey No. 41), the earlier of two *zījes* (see MAG above) written by Muḥyī al-Dīn Yaḥyā b. Muḥammad b. Abī al-Shukr al-Maghribī (656/1258). The copy used is Paris—B.N. MS arabe 2528, ff. 66v-70v. It is to some

degree dependent upon BIR, and not surprisingly, related to MAG.

THF (565), C. *Tuḥfa-i Sulaymānī* (81 localities), an anonymous treatise in Persian, dedicated to Shāh Sulaymān of the Safavid dynasty (c. 1079/1668). Dār al-Kutub (Cairo) MS Ṭalʿat falak fārisī 14, f. 101v. The coordinates were probably obtained from ULG.

TOL (244), A. The Toledan Tables (65 localities, c. 581/1185) as described by G. J. Toomer in *A Survey of the Toledan Tables*, Bruges, 1968, (Osiris, 15), table 83, pp. 134-135. The elements in the published text are numbered, and the number of the locality is given in our reference column.

This table leans heavily upon YUN, hence belongs to the Maṣmūnīc group. Source MRS is essentially a copy of TOL.

TUQ (290), C. *Risāla fi'l-ʿamal bi'l-aṣṭurlāb* (151 localities), ʿAbd al-Ḥalīm b. Suwaylimān al-Ṭuqānī (date unknown), one of a number of treatises bound together in a single volume. MS 500.542 in the collection of the late Dr. Sami Haddad, of the Faculty of Medicine, American University of Beirut. This table is related to SHA.

TUS (330), C. The *Zīj-i Īlkhānī* (272 localities, Survey No. 6) by Naṣīr al-Dīn al-Ṭūsī (c. 669/1270). The copy used is Bodleian MS Hunt 143, ff. 108v-110r. This table seems to stem largely from ATH, and was in turn used by the compilers of the late Persian zījes, MÜN, KAS, and ULG (also the anonymous Arabic ZAH). The presence of a number of localities labelled "Non-inhabited" suggest that the ultimate source, perhaps ATH, was not a zīj, but a list to be used for plotting a world-map.

ULE (530), C. This designates a second geographical table (79 localities, date unknown), following the colophon of the copy of the zīj of Ulugh Beg used for ULG, which see. Hence it is presumably from another zīj. It is practically the same as QIR and SML and is closely related to ABD.

ULG (520), C. The *Zīj-i Sulṭānī* (278 localities, Survey No. 12) by the prince Ulugh Beg b. Shāhrukh b. Taymūr (c. 844/1440). The copy used is Bodleian MS Marsh 396, ff. 98r-99v. This is essentially a copy of TUS, hence one of the group of Persian zījēs.

UTT (230). A zīj (48 localities), anonymous (after 473/1080) and fragmentary, Leiden MS Utr. Or. 23, not foliated. This table is unique in that its longitudes are reckoned from Basra, presumably the compiler's station. This was inferred by comparing the entries in the column headed "difference of longitude" (*faḍl al-tūl*, rather than the usual *atwāl* "longitudes") with differences calculated from other tables. The list carries no word as to whether a particular place is east or west of Basra - the user must know beforehand. In our table, whenever the difference is negative, the remarks column carries a note: Long. W. from Basra. If this does not appear, the locality is east of Basra.

Judging from its latitudes, UTT exhibits a slight inclination toward the Maṣmūnīc group.

YAG (250). The coordinates (149 localities) are from the *Kitāb Muḥjam al-buldān* by Abū ʿAbdallāh Yāqūt b. ʿAbdallāh (c. 617/1220) published as *Jacut's geographisches Wörterbuch...*, ed. by F. Wüstenfeld, 6 vols., Leipzig, 1866-1870. It has also been used as a secondary source for AUN, MLH, MSH, ZIJ and YAG PTO. Our references are to the volume and page of this edition where the locality is named.

YAQ tends to use coordinates from KHU. If a locality is not found in KHU he has recourse to BIR, but without acknowledging the source (although he knew some of al-Bīrūnī's writings). The numbers have apparently suffered from successive scribal errors.

YAQ PTO (064). Coordinates (38 localities) attributed to Ptolemy by Yāqūt may originate with the *Kitāb al-Maḥama* (MLH, date unknown, which see), but they have been recorded as a separate source. More often than not the text gives astrological attributes associated with each city.

YUN (140), A. *Al-Zīj al-kabīr al-ḥākīmī* (291 localities, Survey No. 14) by ʿAlī b. Abī Saʿīd ibn Yūnus (c. 380/990), extant only in fragments. Leiden Cod. Or. 143, pp. 133-136 contains the geographical table. References in our listing are to the page of the manuscript, then the number of the column, finally the number of the locality in the column.

Ibn Yūnus leaned heavily upon KHU, and in turn strongly influenced sources BNY, SHR, MUH, and ZAD. He was therefore a propagator of the Maʾmūnic group.

ZAD (550), A. *Zād al-musāfir*, a zīj (120 localities), was written by ʿIzz al-Dīn Muḥammad b. al-Wāthiq bi'llāh ʿAlī b. Muḥammad al-Daylamī (c.926/1520), who was living in the Yemen when the work was composed. The MS is owned by ʿAbd al-Qādir al-Aḥdal of Zabīd. We have worked from a copy of the microfilm in the collection of the Arab League, Cairo.

The geographical table is on f. 56v (?). It is a member of the Maʾmūnic group, being effectively the same as MUH, a subset of YUN, and closely related to SHR.

ZAH (568), C. An anonymous treatise (86 localities) in a manuscript collection, *Ẓāhirīya* (Damascus) MS ʿāmm 5457/1, f. 5v. References in our listing give the

column of the page in which the locality is found, followed by its place in the column.

Because of the presence of place names in modern Yugoslavia, the author was probably an Ottoman Turk. The table is most closely related to ULG.

ZAY (185), A. This table (298 localities) is from the *Kitāb Aḥkām al-marjān fī dhikr al-madā'in al-mashhūra bi-kull makān* by the Andalusian scholar Ishāq b. al-ḥasan b. Abī'l-ḥusayn al-Zayyāt (d. 450/1058). For a description of the various extant versions of this work, see the forthcoming GAS, vol. 12, Geography. The version used here is entitled *Dhikr al-aqālīm wa'khtilāfuhā* and is contained in Burdur (Turkey) MS 408. The copy is not paginated, and the page numbers in our table commence with the beginning of the table in the MS. References give the page, then an R or an L for the right or left column, then the place in the column.

This table is closely related to KUS and LYD, less so to MAR, hence belongs to the Ma³mūnic group.

ZDG FID (430), A. A zīj (31 localities), reported by FID, and otherwise unidentified (before 710/1310). For the style of reference, see FID. This set of coordinates exhibits no relation to any other, probably because it contains practically no prominent cities.

ZIJ YAQ (248), A. This set of coordinates (22 localities, before 617/1220) is reported by YAQ as coming from *ṣāhib al-zīj*, i.e. a zīj whose author is not named. The zīj of Abū 'Aun may be intended, see AUN YAQ (247). The coordinates have been taken mostly from KHU and SUH, although four are from BIR.

ANALYSIS OF THE DATA

A Measure of Relations Between Sources

A cursory examination of the collection demonstrates that for any particular locality listed in several sources, one or both of the coordinates given by one author will be found for the same locality among other sources. That is, sources tend to be interdependent. To quantify the situation, the following measure of the degree of dependence of any source x upon a second source y has been defined. It is

$$M(x,y) = 100 \frac{I(x,y)}{N(x)},$$

where $I(x,y)$ is the number of localities common to both x and y which have identical latitudes, and $N(x)$ is the total number of localities in source x .

This measure is based upon recommendations made by A. N. Philippou, although his original definition implied a function symmetrical in x and y , hence a measure of the relation between x and y . The modification adopted, suggested by Jihad Mukaddam, is rather an estimate of the dependence of x upon y .

Note that the measure leaves longitudes out of consideration. In principle, a rule involving both coordinates would be desirable, and it is a fact that for a particular place two or more sources frequently report identical longitudes. But it has been seen above that a difference of precisely ten degrees in longitude is also very common, and this, we think, indicates a relation between the sources involved. Moreover, two sources measure longitude from the east rather than the west, and one measures from Basra. For these reasons, longitudes have been left out of the rule.

The definition demands that pairs of corresponding latitudes be exactly equal in order that they make a positive contribution to I . This implies that no allowance is made for scribal errors. A copyist who has

omitted a dot from a numeral, thus converting, say, a 59 into a 19, might just as well have left out the entry entirely, insofar as its contribution to the measure is concerned. It has been noticed that corresponding coordinates in a pair of tables sometimes differ by a consistent small amount, say fifteen minutes of arc. The rule takes no cognizance of these — a miss is as good as a mile.

The coefficient of a hundred makes M a percentage, and since for any two sources the number of places with latitudes in common cannot be greater than the total number of localities, it is always true that

$$0 \leq M \leq 100.$$

If x and y have no localities in common with equal latitudes, for them $M = 0$; if source x is identical with y , then $M = 100$.

In calculating M 's the smaller source always has, as it were, an advantage, for if $N(x) < N(y)$, then $M(x,y) > M(y,x)$, the respective I 's which are the numerators in the fractions forming the M 's being the same in both cases. As an extreme example, form an x by choosing half the localities in some y , together with their coordinates. Then $M(x,y) = 100$, whereas $M(y,x) = 50$.

The square matrix facing page xl exhibits a set of M 's calculated for most of the sources in the collection. The matrix is bordered above and on both sides by corresponding N 's.

It is very easy to make scribal errors in the Arabic alphabetical numerals; the omission of a dot changes the value of the number, and errors tend to cumulate as manuscripts are recopied. Hence the M calculated for two versions of what is supposed to be the same table tends to be surprisingly low. Thus, the source BIR is al-Birūnī's geographical table as found in his published Masudī Canon, whereas BIR FID is the same Canon table as reported by Abū'l-Fidā'. It might be anticipated that $M(\text{BIR FID}, \text{BIR})$ would be close to a

hundred. In fact, it is only 65. For this reason, any *M* of fifty or more implies a close relationship between the two sources involved. If they are of pretty much the same size, and the *M* is as high as eighty, the sources are to be regarded as essentially the same.

A specific example is illuminating. For sources BNA and FAR, prior to a few restorations, calculation produced

$$M(\text{BNA}, \text{FAR}) = 72.$$

Since $N(\text{BNA}) = 90$ and $N(\text{FAR}) = 91$, it did not take a prohibitive amount of time to compare the localities in the two tables pair by pair. This disclosed that where differences in coordinate values exist, for longitudes as well as latitudes, they were explainable as plausible scribal errors. In the single instance of an unresolvable difference in place names, Qandahār versus Qaramān, both known cities and clearly legible, the cursive Arabic representations of the two words bear some resemblance. Unquestionably BNA and FAR are two versions of the same table. Hence the *M* measure can be applied with considerable confidence to large sources where the many hundreds of localities make hand comparison very time-consuming.

Families of Sources

An examination of the relations between sources leads to the definition of three reasonably distinct groups. The earliest, and most numerous, is that dependent upon the work of geographers convened by the Caliph al-Ma'mūn (fl. 820) at Baghdad, their influence maintaining itself throughout the Middle Ages. The group comprises

KHU(Iraq,820) = RES, KHZ, SUH(930), YUN(Egypt, 990), KUS, ZAY(Spain,1048), MUF(Iran,1085), TOL(Spain,1185) = MRS(France), SHR (Yemen, 1260), FAR(Yemen,1260) = BNA, LYD, GT1, QIR (1480) = SML = ULE, ZAD(Yemen,1520) = MUH.

The place and approximate A.D. date of composition are given in parentheses, when known.

A second group consists mostly of *zīj*es, written in Persian, and relatively late. All stem ultimately from the mysterious *Kitāb al-Aṭwāl* (ATH) itself said to have been "of the Persians", so that these tables exhibit an Iranian strain stretching over several centuries. They are

ATH, DST(1100), TUS(Iran,1270) = ULG(Central Asia, 1440), MUN(Iran,1330), KAS(Iran,1420), AIN(India, 1580), THF(Iran,1699), AST(Iran,1710).

Late Islamic astrolabes tend to depend upon this group for their coordinates.

The third family, the smallest, is based on al-Bīrūnī's great *al-Qānūn al-Mas'ūdī* (BIR). It is

BIR(Afghanistan,1040), SNB(Central Asia,1120) = SNH, TAJ(Syria?,1258), ASH(Iran,1310), SHA(Syria, 1350).

The Precision of Medieval Latitude Determinations

The latitude of any locality equals the altitude of the celestial pole at that place. This quantity can be obtained by a simple procedure. The observer notes the altitude, h , of the sun as it crosses the local meridian. He calculates the solar declination, δ , for that time. Then

$$\phi = 90^\circ - (h - \delta)$$

is the desired local latitude.

These facts, well-known since antiquity, should insure a reasonable degree of accuracy in the recorded latitudes, and this turns out to be the case.

For most of the sources the statistics explained below were calculated. For every locality listed in a particular source for which modern coordinates were available, the difference between the text latitude and the accurate value was taken. For each source the mean of the set of differences and the mean of the absolute values of the differences were determined. Before calculating the means, any latitude differences in excess of ten degrees were discarded. The results for seven sources are displayed here.

Source	Localities	Localities with Mod.Coords.	Mean Lat. Error	Mean of Abs. Val. of Err.
KHU	545	195	0°0'	1°37'

TUS	272	200	-0°1'	0°48'
KAS	515	380	0°4'	1°16'
QIR	81	74	-0°5'	0°54'

Since positive and negative errors tend to cancel each other, the mean of absolute values is perhaps the more useful of the two last columns. Over the entire sweep of authors and localities the precision is of the order of one degree, and there is little to choose as between sources. Al-Bīrūnī, the author of BIR, was a careful observer and made a practice of determining the latitudes of places visited in his extensive travels. For such places his values tend to be precise within two or three minutes of arc. But for the great bulk of the hundreds of entries in his table, reaching from Britain to China, he had to depend upon others. The anonymous author of UTT seems to be the best of the lot. But his small table consists of well-known cities, presumably

each having from time to time at least one resident astronomer.

Distribution and Frequency of Places

The collection contains about 2500 different place names. A precise number cannot be given, for about half of the total appear only once, and some of the latter are not separate localities, but unidentified garblings of names occurring elsewhere in the list.

The city of most frequent occurrence is Jerusalem, 65 times, which is not surprising, since it is a holy place for both Islam and Christianity. Following hard after are the specifically Muslim holy cities of Madina and Mecca, with 63 listings apiece. Then is the Abbasid capital Baghdad, 60 times, followed by Damascus, 59; Kufa, 59; Basra, 58; and Alexandria, 57.

A tally of the frequency of occurrence of localities named six times or more in the source, according to the following somewhat arbitrarily chosen thirteen geographical regions came out as follows:

Iran	109
Central Asia	61
Geographical Syria	48
Turkey	47
Arabia	37
Egypt	35
The Indian Subcontinent	30
Iraq	28
North Africa	27
Europe (exclusive of the Iberian Peninsula)	26
The Iberian Peninsula	19
Central and Southern Africa	15
China and the Far East	7

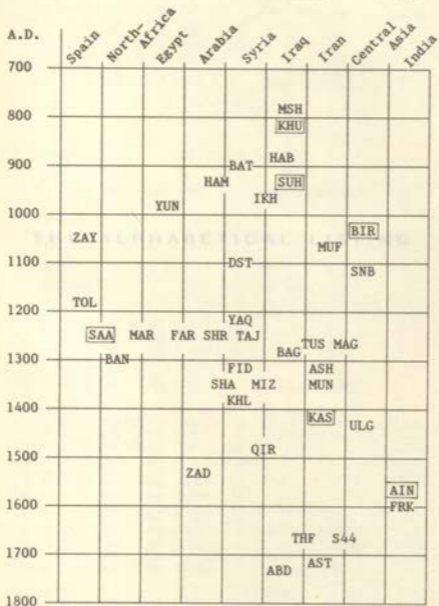

Total	489
-------	-----

This is only a fifth of the grand total of different names listed.

A crude frequency count including all names was made, but the results would be misleading if given in full. In it the leading geographical region was Europe (exclusive of Spain) with 299 localities. This result is presumably a combination of the very large, heavily populated region involved, plus the strong dependence of the larger sources upon the Ptolemaic geography. Second was India, with 294 names, explained by the fact that the largest source is the Indian AIN. A breakdown within the Islamic regions is made impractical because of the uncertainty of location of many of the less frequently named cities, and the impossibility of making precise locations by means of medieval coordinates alone.

Chronological and Geographical Distribution of Sources

Over half of the sources have been dated, and their provenance is known. These have been plotted on the diagram on the facing page with the aid of a vertical date scale, and a location scale trending from west to east. Sources having more than four hundred cities are enclosed in boxes. The distribution is more or less uniform along both axes, pretty well covering the entire Islamic world. It probably would not be altered essentially if it were possible to insert the remaining sources. The notion that scientific activity fell off when the Baghdad caliphate broke up is not borne out by the diagram. If anything, it indicates maximum activity in the thirteenth and fourteenth centuries.

MANUSCRIPTS DESCRIPTIONS INTRODUCTION

السيد جهاد مقدم بوضع البيانات في لغة كمبيوتر مطابقة للكمبيوتر الجديد كما أشرف على الترجمة فيما بعد. وفي هذا الوقت كانت البرفسورة ماري رجير تقدم لنا مشورتها في الأمور الإحصائية بينما زودنا الدكتور رابنهارد فير بما استخرجه من قوائم التقابل بين أسماء الأماكن بالعربية واليونانية. منذ سنة ١٩٨٤م وإثر دعوة من البرفسور فؤاد سركين الذي قدم لنا مشورته ودعمه نعمل في معهد تاريخ العلوم العربية والإسلامية في فرانكفورت. وقد أضفنا إلى المجموعة مصادر أخرى من مكتبة المعهد. إن الكثير من الفضل في النتائج المتوصل إليها يعود إلى الترجمة الفعالة وبالغة الدقة التي قام بها السيد أولريش دورنيوج.

يسرنا الإعراب هنا عن شكرنا لجميع الأشخاص والمؤسسات المساهمة في

هذه الكلمة.

فرانكفورت، جمادى الأولى ١٤٠٧هـ

أدوارد ستينوارد كندي و ماري هلن كندي

وعموماً فإن كل قيد يحتوي إسم مكان (بالحروف اللاتينية والعربية) ودرجة الطول ودرجة العرض ورمز المصدر وموضع ذكر المكان في المصدر وملاحظات ومراجع ثانوية.

كلمة شكر

لقد بدأ هذا المشروع بدعم من مؤسسة العلوم الوطنية في واشنطن سنة ١٩٥٩م كحاشية لبحث العلاقات بين الأزياء (مجموعات جداول فلكية). إن بعض الآلاف من البيانات قام بجمعها السيد فواد أ. حداد في الجامعة الأمريكية في بيروت. وبناءً على اقتراح الفقيه البرفسور وليام براجر فقد نقلت البيانات إلى بطاقات كمبيوتر مثقبة ورتبت وطُبعت على حاسبة من نوع IBM-7070 في جامعة براون، بروفيدنس، رود آيلاند. في ذلك الوقت لم تكن الحاسبات على هذه القوة والكفاءة مثلما هي عليه اليوم، وكل ما كان من الممكن طباعته كان الحروف الكبيرة والأرقام العشرية وقليلًا من علامات التنقيط والرموز الخاصة. إن آثار تلك التقييدات ما زالت ظاهرة في هذه الطبعة.

وتبين بعد أن بدأنا بزم قصير أن الجداول الفلكية لم تكن سوى جزء من مجموعة أكبر بكثير من الكتب المتعلقة بالجغرافيا الرياضية في القرون الوسطى فأضفنا كتباً جغرافية بحثت إلى مصادرها. في سنة ١٩٧٦م نقل العمل إلى مركز الأبحاث الأمريكي في القاهرة مدعوماً بمنحة من مؤسسة سمبسونيان. هناك وفي مراكز أخرى قام البرفسور ديفيد كنج بتزويدنا بمصادر متعددة. وتم في مركز الآلات الحاسبة في الجامعة الأمريكية في القاهرة استبدال البطاقات المثقبة ليحل محلها الشريط المغناطيسي. ثم رجعت المجموعة سنة ١٩٧٨م إلى الجامعة الأمريكية في بيروت حيث قام

مقدمة

إن جداول أسماء الأماكن مع درجات أطوالها وعروضها التي نقدمها هنا مستخرجة من أربعة وسبعين مصدراً تحتوي بيانات يتراوح حجمها بين ٦٥٠ مكاناً ومكانين فقط. والجزء الأكبر من هذه الجداول موجود في الأزياج حيث كانت تكن الفلكيين من تحويل الأرصاد المأخوذة من أحد الأماكن بحيث تتوافق مع أرصاد مأخوذة من مكان آخر. إن بعض المجموعات الكبرى كانت قد عطلت لتكون أساساً لرسم خريطة للعالم بينما نجد مجموعات غيرها في كتب الجغرافيا الوصفية. وهناك جداول منفردة مجهولة المؤلف في أحيان كثيرة صادفناها في مجلدات لمجموعات رسائل في مواضيع مختلفة. وأخيراً فالآلات الفلكية والاسطرلابات خاصة تحتوي أحياناً على قوائم جغرافية منقوشة عليها. وكان بعض هذه القوائم قد تم نشره فأدمنجناه في جداولنا.

على الرغم من أن اهتمامنا موكّر هنا على مواد المصادر الإسلامية من التراث العربي الإسلامي فإننا لم نتردد في الأخذ من مصادر أقدم أو أحدث من تلك الفترة الزمنية إن كانت مهمة لموضوعنا الرئيسي. وهكذا فقد أدخلت في هذه الجداول إحداثيات جغرافية لبطلوس (حوالي ١٨٠ م) الذي كان له تأثيره على الجغرافيين المسلمين. ومن جهة أخرى فقد أدخلت بعض القوائم المتأخرة جداً بناءً على أن محتوياتها ترجع إلى مصادر قديمة.
